

# The future for wound care

## Thank you for your interest in Wound Care Logistics.

We are passionate about all aspects of wound care and our mission is to support wound care experts in improving their service.

Wound Care Logistics was created by a Vascular Surgeon and a General Practitioner to provide wound care service redesign training and facilitation. The service is supported by the award winning LUTM system, that provides a secure wound care shared electronic record system.

When implemented effectively across a locality, the WCL package of training and communication technology can deliver significantly improved healing rates, reduce dressing wastage; generate cash savings and release valuable Community Nurse time for patient care.

### Products

We provide 3 levels of product:

- **Preview Package:** An introductory level product designed to let you see the system for yourself; experience the ease of use; and begin to observe the benefits it brings. The Preview package consists of two 6 month LUTM software licences; two digital cameras; and an introductory training and scoping session for your interested stakeholders. The objective is to have a telemedicine link up and running as soon as possible for evaluation and demonstration.
- **Pilot:** A more extensive rollout within a locality designed to link Primary, Community and Secondary care. The Pilot will allow you to evaluate the potential savings and benefits that the full WCL service can generate.
- **Procurement:** A complete PCT wide system rollout creating significant benefits for Patients (faster healing), District Nurses (released time) and a PCT (financial savings and effortless audit of the whole wound care service).

We envisage that an interested PCT/Locality would work their way through the product levels as their confidence and interest grows.

### The Next Stage

Call or email us to explore how WCL can help you improve wound care services in your area:
